Duration	26 mins 49 secs
Grade	**5.00** out of 10.00 (**50**%)

Question **1**

Incorrect

Mark 0.00 out of 1.00

Create a Python program to delete a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to delete.
2. **Output:**
   - The updated file with the specified line removed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`2`
		`Line one.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
def delete_line(filename, line_number):
    try:
        with open(filename, 'r') as file:
            lines = file.readlines()

        if 1 <= line_number <= len(lines):
            del lines[line_number - 1]

        with open('output.txt', 'w') as file:
            file.writelines(lines)
    except FileNotFoundError:
        pass

import sys

if __name__ == "__main__":
    if len(sys.argv) > 2:
        infile = sys.argv[1]
        try:
            linenum = int(sys.argv[2])
            delete_line(infile, linenum)
        except ValueError:
            pass

```

	Test	Input	Expected	Got	

✗	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`2`
			`Line one.`
			`Line three.`
			`Line four.`
				`***Run error***`
				`Traceback (most recent call last):`
				`  File "__tester__.python3", line 53, in <module>`
				`  with open('output.txt', 'r') as file:`

Question **2**

Incorrect

Mark 0.00 out of 1.00

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description:

1. **Input:**
    - A text file with multiple lines.
    - A line number to reverse.
2. **Output:**
    - The updated file with the specified line's contents reversed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

Output:

Line one.
Line two.
eerht eniL.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`3`
		`Line one.`
		`Line two.`
		`eerht eniL.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
def reverse_line_in_file(input_filename, line_number, output_filename="output.txt"):
    with open(input_filename, 'r') as file:
        lines = file.readlines()

    if 1 <= line_number <= len(lines):
        target_index = line_number - 1
        original_line = lines[target_index]

        if original_line.endswith('\n'):
            reversed_text = original_line[:-1][::-1] + '\n'
        else:
            reversed_text = original_line[::-1]

        lines[target_index] = reversed_text

    with open(output_filename, 'w') as file:
        file.writelines(lines)
```

	Test	Input	Expected	Got	

✗	`with open('output.txt', 'r') as file:`
	`  text = file.read()`

Question **3**

Correct

Mark 1.00 out of 1.00

Develop a Python program to copy the contents of one file to another file.

Description:

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

For example:

Test	Input	Result

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`output1.txt`
		`This is the source file.`
		`It contains multiple lines of text.`
		`Here is another line.`

Answer: (penalty regime: 0 %)

```
source_filename = input()
destination_filename = input()

with open(source_filename, "r") as source_file:
    content = source_file.read()

with open(destination_filename, "w") as dest_file:
    dest_file.write(content)

```

	Test	Input	Expected	Got	

✓	`with open('output1.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`output1.txt`
			This is the source file.
			It contains multiple lines of text.
			Here is another line.
				This is the source file.
				It contains multiple lines of text.
				Here is another line.
					✓

✓	`with open('output2.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`output2.txt`
			Hello, world!
			Python programming is amazing.
			Let's copy this text to another file.
				Hello, world!
				Python programming is amazing.
				Let's copy this text to another file.
					✓

✓	`with open('output3.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input3.txt`
		`output3.txt`
			Single line.	Single line.	✓

Correct

Marks for this submission: 1.00/1.00.

Question **4**

Correct

Mark 1.00 out of 1.00

Develop a Python program to identify and print all palindrome words from a given text file.

Description:

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam

Answer: (penalty regime: 0 %)

```
def find_palindromes(input_filename, output_filename):
    with open(input_filename, 'r') as infile:
        words = infile.read().split()

    palindromes = [word for word in words if word == word[::-1]]

    with open(output_filename, 'w') as outfile:
        outfile.write('\n'.join(palindromes))

find_palindromes('input1.txt', 'output.txt')

```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`	`madam`
			`arora`
			`malayalam`
				`madam`
				`arora`
				`malayalam`
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **5**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a text file and count the total number of words in the file.

Description:

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

For example:

Input	Result
input2.txt	Total words: 14
input3.txt	Total words: 15

Answer: (penalty regime: 0 %)

```
filename = input()
try:
    with open(filename, 'r') as file:
        text = file.read()
        words = text.split()
        print(f"Total words: {len(words)}")
except FileNotFoundError:
    print("File not found.")

```

	Input	Expected	Got	
✓	input1.txt	Total words: 6	Total words: 6	✓
✓	input2.txt	Total words: 14	Total words: 14	✓
✓	input3.txt	Total words: 15	Total words: 15	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **6**

Correct

Mark 1.00 out of 1.00

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

For example:

Input	Result
input1.txt	Longest word: containing

Answer: (penalty regime: 0 %)

```
filename=input().strip()
with open(filename, "r") as file:
    words = file.read().split()

if words:
    clean=["".join(char for char in word if char.isalnum()) for word in words]
    clean=[word for word in clean if word]
    if clean:
        longest_word = max(clean, key=len)
        print(f"Longest word: {longest_word}")

```

	Input	Expected	Got	
✓	input1.txt	Longest word: containing	Longest word: containing	✓
✓	input2.txt	Longest word: thousand	Longest word: thousand	✓
✓	input3.txt	Longest word: supercalifragilisticexpialidocious	Longest word: supercalifragilisticexpialidocious	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **7**

Incorrect

Mark 0.00 out of 1.00

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

Description:

1. **Input:**
    - A text file with multiple lines.
    - A line number to insert the new line at.
    - New content for the new line.
2. **Output:**
    - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

  Inserted line..

Output:

Line one.
Line two.
Inserted line.
Line three.
Line four.

For example:

Test	Input	Result
with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 3 Inserted line.	Line one. Line two. Inserted line. Line three. Line four.

Answer: (penalty regime: 0 %)

```
def insert_line_at_position(input_file, position, new_line):
    with open(input_file, 'r') as file:
        lines = file.readlines()
    if not new_line.endswith('\n'):
        new_line+='\n'

    index = position - 1
    if index>=len(lines):
        if lines and not lines[-1].endswith('\n'):
            lines[-1]+='\n'
        lines.append(new_line)
    else:
        lines.insert(index,new_line)

    with open('output.txt', 'w') as file:
        file.writelines(lines)

```

	Test	Input	Expected	Got	

✗	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
		Inserted line.
			Line one.
			Line two.
			Inserted line.
			Line three.
			Line four.
				Run error
				Traceback (most recent call last):

Question **8**

Incorrect

Mark 0.00 out of 1.00

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

Description:

1. **Input:**
    - A text file with multiple lines.
    - A line number to write to.
    - New content for the specified line.
2. **Output:**
    - The updated file with the specified line replaced by the new content in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Updated line two.
Line three.
Line four.

For example:

Test	Input	Result
with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 2 Updated line two.	Line one. Updated line two. Line three. Line four.

Answer: (penalty regime: 0 %)

```
def replace_line(input_file, line_number, new_content):
    with open(input_file, "r") as file:
        lines = file.readlines()

    if 1 <= line_number <= len(lines):
        lines[line_number - 1] = new_content.rstrip("\r\n") + "\n"
    elif line_number == len(lines) + 1:
        lines.append(new_content.rstrip("\r\n") + "\n")

    with open("output.txt", "w") as file:
        file.writelines(lines)

```

	Test	Input	Expected	Got	

✗	`with open('output.txt', 'r') as file:`
	`  text = file.read()`

Question **9**

Incorrect

Mark 0.00 out of 1.00

Write a Python program to count the frequency of each word in a given text file.

Description:

1. **Input:**
   - String as input.
2. **Output:**
   - A list of words with their corresponding frequency count to be write in a file "output.txt"

Example:

- **Input File Content:**

  apple orange apple banana apple orange

Output:

apple: 3
orange: 2
banana: 1

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`apple orange apple banana apple orange`	`apple: 3`
		`banana: 1`
		`orange: 2`

Answer: (penalty regime: 0 %)

```
import sys
import string
from collections import Counter
text=sys.stdin.read()
words=[]
for word in text.split():
    clean=word.lower().strip(string.punctuation)
```

```
    if clean:
        words.append(clean)
counts = Counter(words)
with open("output.txt", "w") as outfile:
    for word, count in counts.items():
        outfile.write(f"{word}: {count}\n")
```

	Test	Input	Expected	Got

Question **10**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

For example:

Input	Result
input1.txt 3	Line three.

Answer: (penalty regime: 0 %)

```
def read_line(file_path, line_number):
    try:
        with open(file_path, 'r') as file:
            for i, line in enumerate(file, 1):
                if i == line_number:
                    return line.rstrip('\n')
            return "Line not found"
    except FileNotFoundError:
        return "File not found"

file_name = input().strip()
```

```
12 line_num = int(input().strip())
13 print(read_line(file_name, line_num))
14
```

	Input	Expected	Got
